

35. Search Insert Position

Easy Topics Companies

Given a sorted array of distinct integers and a target value, return the index if the target is found. If not, return the index where it would be if it were inserted in order.

You must write an algorithm with $O(\log n)$ runtime complexity.

Example 1:

Input: nums = [1,3,5,6], target = 5
Output: 2

Example 2:

Input: nums = [1,3,5,6], target = 2
Output: 1

Example 3:

Input: nums = [1,3,5,6], target = 7
Output: 4

```
int searchInsert(int* nums, int numsSize, int target) {  
    int low = 0, high = numsSize - 1, mid;  
  
    while (low <= high) {  
        mid = low + (high - low) / 2;  
  
        if (nums[mid] == target)  
            return mid;  
        else if (nums[mid] < target)  
            low = mid + 1;  
        else  
            high = mid - 1;  
    }  
  
    return low;  
}
```

Output:

Input	
nums =	[1,3,5,6]
target =	5
Output	2
Expected	2
